Description of Dataset

SEPD Generation Heatmap

02/10/2023

SSEN Distribution

The dataset demonstrates restrictions/availability of our network via the means of a colour coded heat map. It also includes a download which is available for deeper understanding of the heat map.

Please complete all questions in grey- Comment where Applicable

Final Review

Can this dataset be published ?	Yes
Date of Completion:	02/10/2023
Making reference to documented risk ratings above and the opportunity of sharing this data, what is your justification for this conclusion?	Risk is low- Open classification
What actions are required before this dataset is published? (Include documenting limitations, information for users, and ongoing monitoring required)	Extracting data
Could we do anything to make this dataset more usable to the public? (eg providing definitions, adding in additional data, directing the user to an external party with complimentary additional information)	N/A
How often should this data be updated? (eg once a year, monthly, quarterly, once off?)	Monthly
This assessment has been approved by the following (Sub-Domain Owner or Higher):	Yes
The Risk Specialists consulted (required if any inherent risk score if over 10)	N/A

Guidance

This tab provides guidance for users, to support them in filling out the Data Triage Assessment tab, including definitions and more detailed description.

Key terms

"open data" is where data is freely available to any member of the public

"published" refers to the sharing of this data "score" refers to the impact and likelihood of a specific risk occuring

"score" refers to the impact and likelihood of a specific risk occuring "trigger" is an event which causes an effect

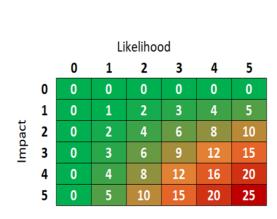

"risk specialist" is someone at SSE with specialist knowledge to advise on risk areas, but is not accountible for the risk being taken (e.g. a lawyer)

"Data Sets" is a collection of related, discrete items of related data that may be accessed individually or in combination or managed as a whole entity.

Risk Likelihood and Impact

A risk is a **trigger** which leads to a **specific event** and has a defined **consequence**, and is quantified with a risk and likelihood (on a scale of 1 to 5) as set out below.

Rating	Score	Likelihood	Impact
		Almost certain to occur (>90%	
Very High	5	likely)	Injury or loss of life
			Regulatory sanctions
			and reputational
High	4	Is likely to occur (<75% likely)	damage
		Is not unlikely to occur (<50%	Reputational damage
Medium	3	likely)	and financial impact
		May occur in rare cases (<25%	
Low	2	likely)	Financial impact only
		Possible but not expected to	Minor effect on
Very Low	1	occur (<10% likely)	efficiency of operations
		Not possible to occur(0%	There would be no
N/A	0	likely)	impact whatsoever

Score

The risk score is calculated by multiplying the impact and likelihood of a risk. Depending on how many risks are over a certain threshold, a "result" will be proposed on a sliding scale of how much risk would be posed by sharing the data. The scoring criteria is explained below. Note for any individual risk with a score greater than 10, please consider the mitigations below.

Criteria	Rating Scale		Justification	Action
Two or more risks with a score above 10		Closed	If there are two risks that cannot be mitigated below a score of 10, then the dataset should not be shared publicly.	This dataset should not be shared publicly unless the risks can be mitigated.
One risk with a score above 10			Where there is a single risk that can not be mitigated below a 10, it means there is a risk that is somewhat likely to occur, and have a considerable impact. This does not necessarily mean the data must not be shared, but the risk should be carefully considered if deciding to proceed.	To determine whether the dataset can be shared given the risk profile, consult with the relevant specialists (see guidance) for the risks posed.
2+ risks have a score between 8 & 10 (inclusive)		Shared	When a dataset has more than 1 risks with a score higher than 8 (but lower than 10) it means there are valid risks to consider.	The data owner and the Open Data Team should discuss if this data can be openly published, and consider providing it to a limited audience.
1 risk has a score above an 8			Datasets with a single risk between 8-10 means there is perceived to be just one category where a valid risk needs to be considered before publishing the data. The likelihood and impact are not seen to be very high.	In most cases it should be possible to share this data openly, unless the data owner believes any mitigations or restrictions would be appropriate.
No scores above a 7		Open	Of all the risks presented, none that would have a significant impact are seen to be likely	These datasets should be shared openly without restrictions.

Mitigation Technique	Summary Description of approach	Effect on risk	Reference
	Data is released under access control, such as a user name and	This lowers the probability of sensitive data	
	password, to manage readership for licensing or technical	being accessed by a wider audience, making it	
Access Control	reasons. This allows us to share the data to some extent, but is	easier to monitor who is using the data.	https://odileeds.github.io/open-data-tips/technique/access-control
		The probability of deliberate or accidentally	
	Combining data to reduce the level of detail in terms of time,	identification is reduced, but it may in turn	
Aggregation	physical space or individuals	become less useful	https://odileeds.github.io/open-data-tips/technique/aggregation
	Removing personal identifiers, both direct and indirect, that may	Lowers or avoids risks associated with	
Anonymisation	lead to an individual being identified	information being attributed to an individual	https://odileeds.github.io/open-data-tips/technique/anonymisation
	Replaces a specific field such as age with a reference to a range	Lowers risks associated with information being	
Data Binning	(e.g. replacing a person's age with "18-25")	attributed to an individual	https://odileeds.github.io/open-data-tips/technique/binning
		Can reduce risks associated with data being	
	Data is published after a pre-defined delay so that the user can	used to follow an individual or organisations	
Delayed Publication	not see "real time" data	activity in real time	https://odileeds.github.io/open-data-tips/technique/delayed-publication
		Reduces the accuracy of the dataset in the	
		interest or risk reduction, but may make the	
Obfuscation	Hiding original data with modified content	dataset less useful	https://odileeds.github.io/open-data-tips/technique/obfuscation
	Seperating the personal information from the dataset, and	Lowers risks associated with information being	
	replacing it with a reference to the information held elsewhere	attributed to an individual, but allows it to be	
Seudonymisation	(e.g. a staff ID number instead of the employee name)	easily re-attributed by SSEN if needed	https://odileeds.github.io/open-data-tips/technique/pseudonymisation
		Can help reduce the risk of identifying	
		individuals from a dataset, but may make it less	
Randomness	Altering the data to introduce noise which makes it less accurate	useful	https://odileeds.github.io/open-data-tips/technique/randomness
		Avoid releasing sensitive data while being	
	Removing certain data or replacing it with dummy data (e.g.	transparent about what has been removed, but	
Redaction	"REMOVED"), including entire fields, or entire records	may make it less useful	https://odileeds.github.io/open-data-tips/technique/redaction
		Reduces risks related to commercial sensitivity	
	A license is applied which sets restrictions on how the data can	or security concerns related to specific groups,	
Restrictive Licensing	be used, and defines permissions for onward sharing	but is no longer open	https://odileeds.github.io/open-data-tips/technique/restrictive-licensing
	Generates a dataset with the same properties as a real dataset,	Is arguably not open data, but allows us to avoid	
	but using fake data. For example a fake list of employee names,	the risk of sharing personally identifiable	
Synthetic Data	that accuratly reflects the real gender and race demographics of	information at the cost of accuracy	https://odileeds.github.io/open-data-tips/technique/synthetic-data
